Creative, Permanent Solutions

Ligamed Medical Equipment Industry and Trade Ltd. as a designer, manufacturer and seller of spinal surgery implants, its product portfolio consists of "Thoracolumbar Stabilization System", "Cervical Cage and Prosthesis System", "Lumbar Cage System", "Anterior Cervical Plate System", "Posterior Cervical System" and "Corpectomy Mesh System". We present our innovative implants, surgical instruments and set structures that exist in Spinal Systems in our catalog to our valued business partners and users.

CERVICAL SYSTEM

CERVICAL CAGE

CERVICAL CAGE

The Cervical Cage is made of Peek and Titanium material, compatible with MRI and CT. It does not allow any lesion problems. It was implanted from the anterior approach using the Smith-Robinson technique. Thanks to the Octagonal surface feature, which facilitates a strong fixation by the superior and inferior area, any additional implantation

it is not necessary as a plate. Determination of the appropriate size through experiments and implantation with a single instrument offer an easy application and time-saving advantage to the user.

- * Areas where the corpus of the cage is to hold and makes it easy to get in contact with serrated
- * The cages are perforated and designed to be filled with bone grafts.
- * The large contact surface of the cage prevents crashes and Corpus
- * There are different cage sizes for anatomy. The of the cage; it is between 4 mm and 10 mm

CERVICAL DISC PROSTHESIS

CERVICAL DISC PROSTHESIS

- Ti-6Al-4V ELI (ISO 5832-3) Titanium Alloy Material
- Anatomical Design
- One Piece Bridge System With High Mobility
- Special Yarn Structure Providing Strong Adhesion
- Special Titanium Sand Blasting and Porous Coating
- Roughening Simple Implantation

CERVICAL CAGE WITH PLATE

The Cervical Cage is made of and Titanium material, compatible with MRI and CT. It does not allow any lesion problems. It was implanted from the anterior approach using the Smith-Robinson technique. Due to the toothed surface feature, which facilitates a strong fixation by the upper and lower area, any additional implantation, such as a plate, is not required. Oct. Determining the appropriate size through trials and implantation with a single instrument offers the user the advantage of an easy application and time savings.

- The areas of the cages in contact with the corpus are serrated and make it easier to hold
- The cages are perforated and designed to be filled with bone grafts.
- The large surface of the cage contacts the corpus and prevents it from collapsing
- There are cage sizes for different anatomies. The dimensions of the cages are between 4 mm and 10 mm Decoupled.

ANTERIOR CERVICAL PLATE - SCREW SYSTEM

Anterior Cervical Plate System consists of mobile and fixed safety screws, plate which provides high strength with low thickness, screws of mobile and fixed bone anchorage.

Blocking system that avoids the anteropulsion of screws are compatible and effective with the plate. The mobile safety screws allow poliaxial angulation of 15° . The fixed safety screws are placed perpendicularly to the plate in order to obtain more solid fixings. The ionically anodized surface avoids friction wearing out and boosts resistance to fatigue. The rounded peripheral rim lowers the aggressiveness of the implant over soft tissues. It provides effective and simple use.

- Improved intraoperative application and various dimension options
- Low profile design with specially designed screw locking
- It has a slim outer appearance (2 mm)
- The size range of the plates is from 14 mm to 100 mm
- There are screws with diameters of 4 mm and 4.5 mm
- Screw lengths vary between 6 mm and 20 mm
- Structure easy to apply.

POSTERIOR CERVICAL STABILIZATION SYSTEM SCREW-ROD-CONNECTOR-DOMINO

Posterior Cervical Fusion is a procedure intended for the stabilization of the cervical spine through a posterior approach. The procedure is commonly performed using hooks, plates, screws and rods as an adjunct to the fusion. Posterior Cervical Fusion is performed to treat instabilities which arise from: degenerative disc disease, spondylolisthesis, spinal stenosis, fracture/dislocation, atlantoaxial fractures with instability, occipito-cervical dislocation, revisions of previous cervical spine surgery and tumors. Posterior Cervical System is an enhanced set of instruments and implants, including variable size screws, hooks, connectors, domino and rods, designed for posterior stabilization of the upper spine. These implants provide the flexibility required to accommodate variations in patient anatomy.

- Completely compatible with the cervical anatomy
- Low profile design and special designed screw locking
- Color anodizing for specifying the different screw diameters
- Suitable lengths and diameters for each level (Many alternative size)
- There are screws with diameters of 3.5 mm and 4.0 mm
- Posterior Cervical System uses 3.5 mm titanium alloy rods.
- Structure easy to apply

POSTERIOR CERVICAL STABILIZATION SYSTEM CONNECTORS OCCIPITAL PLATE-HOOK

Lateral Connector

- Accommodates rod attachment of non-linear screws
- Allows for increased angle of screw trajectory
- Accounts for screw height differences

Hooks

There are five hook options: Pedicle Hooks, Laminar Hooks, Poliaxial Hooks, Offset Hooks, Transverse Hooks

Laminar Hook

Pedicle Hook

Occipital Plate

Is intended is intended to provide stabilization as an adjunct to fusion of the cervical spine and occipito-cervicothoracic junction for the following indications: degenerative disc disease (neck pain of discogenic origin with degeneration of the disc, spondylolisthesis, spinal Osteoarthritis, fracture/dislocation, atlanto-axial fracture with instability, occipito-cervical dislocation, revision of previous cervical spine fusion surgery and tumors.

The Occipital plate includes a complete set of implants and instruments designed to optimize fixation to the occiput and easily connect with all posterior cervical and thoracic rod-screw systems.

LUMBAR CAGE SYSTEM

POSTERIOR LUMBAR INTERBODY FUSION (PLIF)

PLIF PEEK CAGE

PLIF TITANIUM CAGE

PLIF TITANIUM
EXPANDABLE CAGE

PLIF PEEK EXPANDABLE
CAGE

The Posterior Lumbar Interbody Fusion (PLIF) procedure is intended to stabilize the spine by causing bone to grow between the two vertebral bodies, thus limiting motion at that level. PLIF achieves spinal fusion surgery, typically a pedicle screw construct;

Posterior Lumbar Interbody Fusion Cage is manufactured from peek and Titanium alloy material which is compatible with MRI and CT. Does not allow any lesional problems. It's implanted from posterior approach for following indications:
Mechanical by superior and inferior area. Through it's grafting spaces, it's possible to reach appropriate fusion by grafting technique.

There are cage sizes for different anatomies. The sizes of the cages; it is between 6 mm and 15 mm.

BIOMECH NON-STERILE LUMBAR PLIF CAGE, EXPANDABLE, TITANIUM 16 MM	I 103.0000016NS

TRANSFORAMINAL LUMBAR INTERBODY FUSION (TLIF)

An adaption of the Posterior Lumbar Interbody Fusion (PLIF) procedure, the TLIF technique employs a unilateral approach to the disc space through the intervertebral foramen. Requiring only a partial unilateral facet resection, the TLIF procedure when compared to a PLIF;

- Preserves the laminar arch and contralateral facet
- Avoids bilateral scarring
- Avoids significant dural retraction which may reduce the risk of intraoperative dural tears
- Offers a revision strategy that may not exist with a PLIF due to bilateral scarring

The unique unilateral TLIF approach requires specific implants and instrumentation to facilitate thorough disc space preparation and accurate cage placement.

Transforaminal Lumbar Interbody Fusion is designed as compatible to anatomical constitution at different sizes. It is manufactured from PEEK and Titanium alloy material which is full compatible with body. It allows to obtain full and quick

fusion through the slots which are on it's surface. These slots doesn't effect the endurance which cage resists against the pressure caused by body weight. It is fixed to body strongly through the teeth at it's inferior and superior surface.

There are cage sizes for different anatomies. The sizes of the cages; it is between 6 mm and 16 mm.

ANTERIOR LUMBAR INTERBODY FUSION (ALIF)

Anterior Lumbar Interbody Fusion (Alif) alleviates pain through the removal of a damaged or diseased disc through an anterior approach.

This procedure involves the complete removal of the intervertebral disc and the implantation of an interbody fusion device to restore intervertebral height and fuse the vertebral bodies of the affected segment.

Anterior Lumbar Interbody Fusion Cage is manufactured from peek and Titanium alloy material which is compatible with MRI and CT.

There are cage sizes for different anatomies. The sizes of the cages; it is between 9,5 mm and 15,5 mm.

LUMBAR LATERAL INTERBODY FUSION XLIF CAGE

GENERAL DESCRIPTION

LUMBAR LATERAL INTERBODY FUSION XLIF CAGE system is consisted of components made of peek (Polyether Ether Ketone) and Titanium raw materials compatible with the Lumbar disc anatomy and interconnected by a one-way bridge from the central section.

The upper surfaces of the superior (upper) and inferior (lower) parts of the system are threaded and 4 (four) pins specially made of titanium alloy are placed, thus driving the material into the bony tissue and preventing it from shifting. Also, titanium pins provide great convenience in terms of choosing the area where the material is to be placed.

Expandability of the system is also provided by a distracter (space expander). As the distracter is also a spaced and locked apparatus, it both performs the space expansion as required by the physician and provides safe use of the expander thanks to its locking mechanism while applying this method as well. All these components are supplied in a container (carrying box) and sterile boxes complete with instruments of several different shapes and dimensions.

BIOMECH Rigid Lumbar Cage implants are manufactured of PEEK material due to their high bio-compatibility and to the fact that they may be imaged better in such radiological examinations as MR, CT, etc. **FOR USE ON OR BY THE ORDER OF A PHYSICIAN, SURGEON OR SPECIALIST DOCTOR ONLY.**

LUMBAR INTERSPINOUS FUSION DEVICE

GENERAL DESCRIPTION

Ligamed Interspinous Fusion Device is a implant that is designed to fit between the spinous processes of the lumbar spine. Consists of a single component with deployable superior and inferior projections that engage the spinous processes to secure it in place. Ligamed Interspinous Fusion Device is provided non-sterile in different sizes.

Interspinous Fusion Device is provided as non-sterile and sterile formo in different sizes.

NON-STERILE INTERSPINOUS FUSION DEVICE

THORACOLUMBAR STABILIZATION SYSTEM

(POLYAXIAL – MONOAXIAL – SPONDYLOLISTHESIS – CANNULATED)

- Polyaxial and Spondylolisthesis screws enable screw angulations up to $\pm 27, 22$ degrees.
- With their double grooved and double diameter features, pedicle screws are highly resistant to loosening. Besides, it helps its user for faster and more controlled implantation.
- They are flexible enough to be implanted wherever needed.
- Color coding enables to differentiate between screw sizes.
- A specific thread structure is used to increase the compatibility of screw body and the locking screw (nut). Thus, pedicle screw, rod and locking screw can grip more safely.
- There are many screw sizes for different anatomies. The diameters of the screws; these are 4.5 - 5.5 - 6.0 - 6.2 - 6.5 - 7.0 - 7.5 - 8.5 mm.

RODS & LOCKING SCREW

Titanium Rods

Chromium-Cobalt Rods

Dynamic Rods

Peek Rods

Pre - Bend Peek Rods

Elastic Rods

Long Locking Screw

Locking Screw

Grooved Locking Screw

Rods

- Titanium alloy rods “Ti6Al4V-ELI, grade 5”, Chromium-Cobalt alloy rods “Cr-Co-Mo”, Peek and Dynamic Rods that are used for dynamic stabilization
- They provide optimum load distribution
- Rod diameters are 5.5 mm
- Rod lengths vary between 45 mm and 600 mm

Locking Screws

- Three different types
- It locks the movement mechanism
- A special thread profile (reverse angle) is applied to the locking screw, for a tighter hold and stabilization.

Connectors

Connectors are intended to provide immobilization and stabilization of spinal segments in skeletally mature patients as an adjunct to fusion in the treatment of acute and chronic instabilities or deformities of the thoracic, lumbar and sacral spine.

Connectors and Multiaxial connectors providing increased stability to all the spine rod-screw construct. Connectors effectively increase the rigidity of rod-screw constructs in the spine. Connectors can be placed between the rods to increase stability

Lateral Connector

Multiaxial Connector

Omniaxial Connector

Domino

- Domino: is a device designed with the aim to ensure intervertebral fusion of the cervical segment of the spine and which purpose is to restore the disc height, by means of anterior stabilization. It is made of an intervertebral fusion cage and a reduced-profile cervical plate, properly integrated.

Crosslink

- is one such low-profile spinal instrumentation system spine surgeons are using to segmentally stabilize spinal instability and deformity. In general, crosslinking devices are simple transverse/ placed implants that connect the implants (rod) on one side of the spine to the implants (rod) on the other side. The use of crosslinking devices to provide additional stability to posterior spinal instrumentation constructs is universally accepted.
- Designed to speed up and facilitate connection.
- Crosslink lengths are 40-60-80-100 mm.
- It clings easily and effortlessly.

Posterior Sacro-Iliac Screw

- Sacroiliac screw: The sacral percutaneous fixation has many advantages but can be associated with a significant exposure to X-ray radiation. Currently, sacroiliac screw fixation represents the only minimally invasive technique to stabilize the posterior pelvic ring. It is a technique that should be used by experienced surgeons.

Posterior Iliac Connector

- The posterior iliac connector is an implant component used in spinal surgery to provide fixation between the spine and the pelvic bone. It is especially utilized in long-segment spinal fusions to enhance stability at the lumbosacral junction. This connector links the spinal rod to iliac screws, helping to distribute mechanical loads more evenly. Made from durable materials like titanium, it comes in various shapes and sizes. Its modular design allows for intraoperative flexibility and strengthens the overall construct.

Posterior Sacral Block

- The posterior sacral block is a regional anesthesia technique applied from the posterior aspect of the sacrum. In this method, the sacral nerve roots are targeted to temporarily block pain transmission to the pelvis, perineum, buttocks, and lower extremities. It is commonly used in anorectal surgeries, labor pain management, or treatment of chronic pelvic pain. The procedure involves injecting local anesthetic agents into the sacral foramina using a needle.

Posterior Sacral Screw

- SA posterior sacral screw is a surgical implant used to stabilize fractures and dislocations of the pelvic ring, particularly those involving the posterior (back) portion of the pelvis. These screws are inserted into the sacrum, the bone at the base of the spine, and are commonly used to help maintain anatomical alignment and provide stability.

CORPECTOMY MESH

CORPECTOMY MESH SYSTEM

Corpectomy Mesh is a vertebral body replacement device for the cervical, thoracic and lumbar spine. Titanium alloy implants in various footprints and heights enable the surgeon to choose the configuration that is best suited to the patient's individual pathology and anatomy. The mesh may also be trimmed for a custom fit.

The implants can be inserted anteriorly, laterally or anterolaterally.

- The round and cylindrical implants are designed to treat defects in the cervical, thoracic and lumbar spine
- Available in a wide variety of diameters, lengths and styles
- Greater strength limits deformation
- Greater thickness provides more surface area coming into contact with host bone
- Less deformation during impaction and even stress distribution
- Less risk of damaging soft tissues
- Smooth insertion
- Easier manipulation into tight spaces
- Provides enhanced imaging and excellent biocompatibility

Corpectomy Mesh
